

**APPENDIX****IN THE SPECIFICATION:**

Page 7, line 22 - page 8, line 5:

--Voice over IP gateway 36 is connected to IP routing means comprising a processor 38 within module 2. Processor 38 is deemed to comprise a number of submodules including a dynamic host conversion protocol/network address translation (DHCP/NAT) submodule, a packet priority submodule and an IP routing submodule. These submodules may be either hardware modules or subroutines preprogrammed to processor 38. In brief, the DHCP/NAT submodule provides dynamic address assignments for connecting to the Internet so that, as far as the internet is concerned, module 2 looks like any other PC connection. This is important insofar as ordinarily if a device is connected to a communications network, a particular address is assigned to that device. And since there is only one address assigned to a given device, prior to the instant invention, only one type of communication is deemed possible at any one time via that device.--

**IN THE CLAIMS:**

1. (Currently Amended) Apparatus for enabling more than one communicative process to be carried on at the same time over a subscriber line, comprising:

a network interface means for connecting to a [telecommunications network] circuit switched telephone network;
